Softer is better

The drinking water softener Logawater soft from Buderus protects water pipes and household appliances from calcification – a salt grid, a colour display and optional app connection ensure convenient operation

Hard water causes limescale, which shortens the lifespan of drinking water pipes and household appliances such as washing machines and dishwashers. Skin and hair also suffer from hard water when showering. The compact drinking water softener Logawater soft provides a remedy: It uses an ion exchange process to exchange all hardness-causing calcium and magnesium ions in the water for sodium ions. The result is pleasantly soft water in single-family homes or apartment buildings. The drinking water softener will be available from July 2023 in the two variants Logawater soft WE500 and Logawater soft WE800i, each with a resin volume of 9, 14 or 18 litres.

Connectivity included

The space-saving electric water softener is installed at the mains water supply. This is done by specialists in a few simple steps. Soft water is produced based on the ion exchange principle: The Logawater soft contains a resin loaded with sodium ions that exchanges hardness-causing minerals such as calcium and magnesium for sodium ions. If the resin is saturated, salt is used to regenerate it. Convenient: The salt tablets are filled directly into the designated chamber via a special insert. The Logawater soft WE800i variant has an LED light ring, which indicates the salt level – this keeps users informed without having to open the lid.

The status can also be conveniently monitored via an app, as the Logawater soft WE800i models from system expert Buderus come standard-equipped with a WiFi interface. The MyBuderus app informs home owners about the current operating status and any faults. In addition, the app shows when the next salt filling is due. If required, the Logawater soft WE500 variant can be retrofitted with

hardware and is then also WiFi-enabled. Convenient for maintenance: Servicing can be done together with the regular maintenance of the heating system.

High-quality design

End customers benefit from the possible eligibility of the Logawater soft for funding under the Federal Funding for Efficient Buildings (Bundesförderung für effiziente Gebäude – BEG). The standard-fitted leakage detection system contributes to safe operation. Last but not least, the drinking water softener cuts a fine figure in any installation room: Its high-quality black surface, glass lid, colour touch display and LED light ring make the Logawater soft WE800i a real eye-catcher.

Buderus, one of Europe's strongest brands in the thermotechnology sector, is a provider of efficient and reliable system solutions for heating, ventilation and cooling. As a systems expert for heating and installation technology, Buderus is distinguished by its consulting expertise, integrated services and perfectly matched energy-efficient and connectable heating systems from a single source. The product portfolio covers everything from heat generators for liquid and gaseous energy sources to storage tanks, controls and heating accessories to a comprehensive range of renewable energy systems such as heat pumps and solar thermal systems.

All Buderus products offer maximum system compatibility, as all components are perfectly matched. This enables trade partners to install individual solutions quickly and efficiently, both in new and existing buildings, regardless of whether the system is large or small.
